

PROBLEMS

Water in the soil

Waterlogging is a common problem in gardens, especially in low-lying areas. It can be caused by heavy rain, poor drainage, or overwatering. Symptoms include yellowing leaves, wilting, and stunted growth. To prevent waterlogging, ensure your garden has good drainage and avoid overwatering. If you have a problem, you may need to raise the garden bed or install a drainage system.

Planting too close

Planting too close together can lead to overcrowding, which can reduce the plants' ability to grow and thrive. It can also increase the risk of disease and pest problems. To avoid this, make sure you have enough space between your plants. Check the spacing requirements for each plant and follow them carefully.

PLANTING

When planting, make sure you have enough space between your plants. Check the spacing requirements for each plant and follow them carefully. This will help them grow and thrive without overcrowding.
